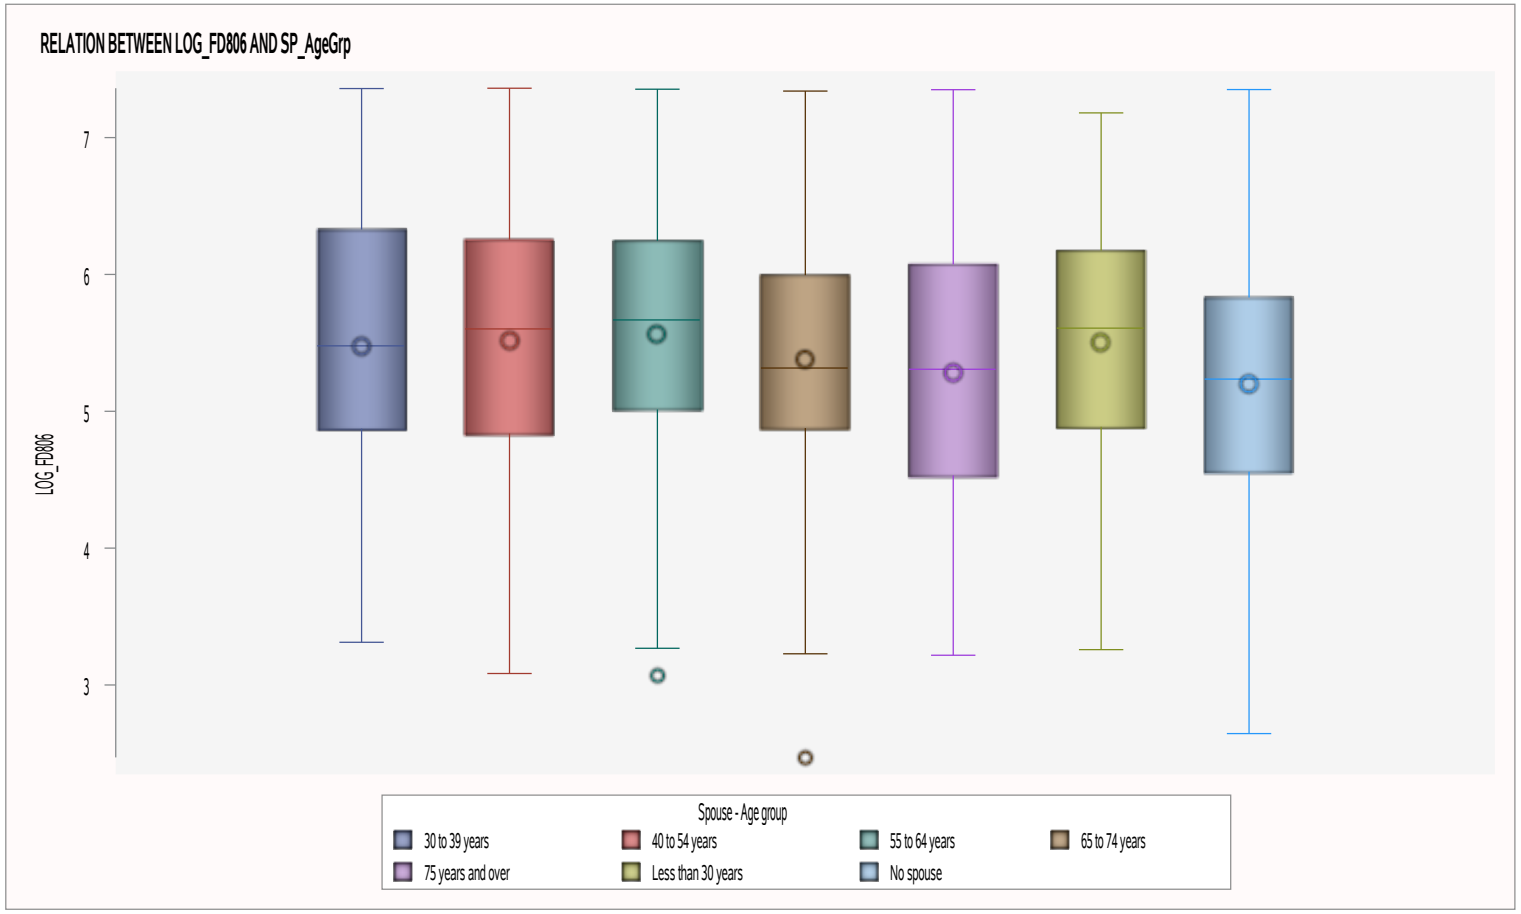
55 to 64 years	1237655	1237655	0	3.07	5.00	5.67	5.56	6.25	7.35	1.25	16.36	5.56	5.56	-0.27
65 to 74 years	642970	642970	0	2.47	4.86	5.32	5.38	5.99	7.34	1.13	16.48	5.38	5.38	-0.13
75 years and over	329381	329381	0	3.22	4.52	5.31	5.28	6.07	7.35	1.56	18.03	5.28	5.28	-0.13
Less than 30 years	313417	313417	0	3.26	4.87	5.61	5.50	6.17	7.18	1.30	16.97	5.50	5.51	-0.44
No spouse	2907981	2907981	0	2.64	4.54	5.24	5.20	5.83	7.35	1.29	18.07	5.20	5.20	-0.06



One-way ANOVA Assumptions
In order to run a one-way ANOVA the following assumptions must be met:
1.The response of interest is continuous and normally distributed for each treatment group:
Normality test: PROC UNIVARIATE NORMAL and QQPlot for each group.
2.Treatment groups are independent of one another. Experimental units only receive one treatment,and they do not overlap.
3.There are no major outliers.
4.A check for unequal variances will help determine which version of a one-way ANOVA is most appropriate
(Levene's test, Null hypothesis: variances are equal between groups):
A .If variances are equal, then the assumptions of a standard one-way ANOVA are met.
B. If variances are unequal, then a Welch's one-way ANOVA is appropriate.

Normal Distribution?
Null hypothesis: sample has a normal distribution
CLT :
a.If it looks normal and each group have more than 30 observations
b.If moderately skewed, each group must have more than 100 observations
*rule of thumb: If skewness is between -1 and -0.5 or between 0.5 and 1, the distribution is moderately skewed.
*if the sample size is over 2000, the Kolmgorov test should be used. If the sample size is less than 2000, the Shapiro test is better.

3.05777	7665	1968	7.35109	759	1777

Null hypothesis: equal variances
a.If variances are equal, then a pooled t-test is appropriate
b.If variances are unequal, then a Satterthwaite (also known as Welch's) test is appropriate

The GLM Procedure
