

BIVARIATE ANALYSIS OF RP_Sex AND LOG_FD806 FOR ANA.MODEL2

RELATION BETWEEN LOG_FD806 AND RP_Sex

11:42 Saturday, November 20, 2021 1

The MEANS Procedure

Analysis Variable : LOG_FD806														
Reference person - Sex	N Obs	N	N Miss	Minimum	Lower Quartile	Median	Mean	Upper Quartile	Maximum	Quartile Range	Coeff of Variation	Lower 95% CL for Mean	Upper 95% CL for Mean	Skewness
Female	4262186	4262186	0	3.07	4.65	5.41	5.37	6.06	7.36	1.41	17.81	5.37	5.37	-0.08
Male	3866690	3866690	0	2.47	4.76	5.42	5.40	6.05	7.36	1.30	17.14	5.40	5.40	-0.23

Null hypothesis: There's no difference in means
Assumptions:
1.Sample distribution must be normal:
e.g:Shapiro (null hypothesis: sample has a normal distribution)
CLT :
a.If it looks normal and each group have more than 30 observations
b.If moderately skewed, each group must have more than 100 observations
2.Groups are independent of one another.
3.There are no major outliers.
4.A check for unequal variances will help determine which version of an independent samples t-test is most appropriate:
(e.g:Levene's test, null hypothesis: equal variances)
a.If variances are equal, then a pooled t-test is appropriate
b.If variances are unequal, then a Satterthwaite (also known as Welch's) t-test is appropriate

Normal Distribution?
Null hypothesis: sample has a normal distribution
CLT :
a.If it looks normal and each group have more than 30 observations
b.If moderately skewed, each group must have more than 100 observations
*rule of thumb: If skewness is between -1 and -0.5 or between 0.5 and 1, the distribution is moderately skewed.
*if the sample size is over 2000, the Kolmogorov test should be used. If the sample size is less than 2000, the Shapiro test is better.

The UNIVARIATE Procedure
Variable: LOG_FD806

Freq: WeightD

Reference person - Sex=Female

Moments
